PC401EC	Analog Electronic Circuits					Core	
	Contact Hours per Week				CIE	SEE	Credits
Prerequisite	L	T	D	P			
PC304EC	3	-	-	-	30	70	4
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Analyze frequency response of Amplifiers in different frequency ranges.							
2. Familiarize with concept and effect of negative feedback							
3. Study positive feedback and Design different types of oscillators							
4. Design Power Amplifiers and calculate their efficiencies							
5. Familiarize with concept of tuned amplifiers							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Design and analyze frequency response of different amplifiers using BJT and FET.							
2. Identify the type of negative feedback, analyze and design of negative feedback amplifiers							
3. Design Audio Frequency and Radio Frequency oscillators.							
4. Distinguish between the classes of Power Amplifiers and their design considerations.							
5. Compare the performance of single and double tuned amplifiers							

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12
CO1	3	2	1	1	-	-	-	-	-	-	-	1
CO2	3	2	3	2	-	-	-	-	-	-	-	2

CO4	3	2	3	3	1	-	-	-	-	-	-	2
CO5	3	2	3	2	-	-	-	-	-	-	-	2

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>UNIT I</b>
<b>Small signal amplifiers:</b> Classification of amplifiers. Mid-frequency, Low-frequency and high frequency analysis of single and Multistage RC coupled amplifier with BJT & FET. Analysis of Transformer coupled amplifier at mid-frequency, low-frequency and high frequency.
<b>UNIT II</b>
<b>Feedback Amplifiers:</b> The feedback concept, General characteristics of negative feedback amplifier, Effect of negative feedback on input and output impedances, voltage and current, series and shunt feedbacks, Stability considerations, Local Versus global feedback.
<b>UNIT III</b>
<b>Oscillators:</b> Positive feedback and conditions for sinusoidal oscillations, RC oscillators, LC oscillators, Crystal oscillator, Amplitude and frequency stability of oscillator. <b>Regulators:</b> Transistorized series and shunt regulators.
<b>UNIT IV</b>
<b>Large Signal Amplifiers:</b> BJT as large signal audio amplifiers, Classes of operation, Harmonic distortion, power dissipation, efficiency calculations. Design considerations of transformer coupled and transform less push- pull audio power amplifiers under Class-A, Class-B, Class-D and Class-AB operations.
<b>UNIT V</b>

**R.F. Voltage Amplifiers:** General considerations, Analysis and design of single tuned and double tuned amplifiers with BJT, selectivity, gain and bandwidth. Comparison of multistage, single tuned amplifiers and double tuned amplifiers. The problem of stability in RF amplifiers, neutralization and uni-lateralisation, introduction to staggered tuned amplifier.

Course Code	Course Title					Core/PE/OE	
PC 402 EC	<b>COMPUTER ORGANIZATION AND ARCHITECTURE</b>					Core	
	<b>Contact Hours per Week</b>				<b>CIE</b>	<b>SEE</b>	<b>Credits</b>
<b>Prerequisite</b>	<b>L</b>	<b>T</b>	<b>D</b>	<b>P</b>			
PC302EC	3			3	30	70	3
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Understand various number representations and perform binary, fixed-point, and floating-point arithmetic operations.							
2. Learn the internal hardware organization of computers including control unit design using hardwired and microprogrammed techniques.							
3. Analyze CPU design concepts including instruction formats, pipelining, and performance metrics such as CPI and Amdahl's Law.							
4. Examine memory hierarchy, virtual memory, cache design, and modern memory technologies relevant to system performance.							
5. Explore input-output interfacing techniques, communication protocols, and embedded system integration including SoC and modern ISAs like RISC-V and ARM.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Perform binary, fixed-point, and floating-point arithmetic relevant to computer systems and AI applications.							
2. Design and describe the datapath and control units of a CPU using register-transfer level (RTL) principles.							
3. Explain the instruction cycle and analyze the effect of control sequencing, pipelining, and interrupt mechanisms.							
4. Analyze and evaluate memory systems, cache performance, and virtual memory operations in computing systems.							
5. Design and assess I/O subsystems including DMA, bus communication, and interface protocols for peripheral devices.

CO4	2	-	-	-	3	-	-	2	-	-	-	-
CO5	-	-	3	-	-	-	2	-	1	-	-	-

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

#### UNIT I

**Data Representation and Arithmetic Operations-** Number systems and binary codes, Fixed and floating-point representation (IEEE-754). Binary arithmetic: addition, subtraction, Booth's multiplication, restoring and non-restoring division. Low-precision formats (INT8, bfloat16) and relevance to AI applications.

#### UNIT II

**Computer Organization and Control Unit-** Instruction codes, stored program concept, computer registers, common bus system. Instruction cycle: fetch, decode, execute, and interrupt. Control unit design: hardwired and microprogrammed control, RTL basics. Microinstruction sequencing and control word format.

<b>UNIT III</b>
<b>CPU Architecture, Pipelining, and Modern ISAs-</b> Register and stack-based organization, instruction formats, addressing modes. Datapath and control path design. RISC vs CISC architecture, Instruction pipelining, hazards. Performance metrics: CPI, IPC, Amdahl's Law, Introduction to RISC-V and ARM architectures.
<b>UNIT IV</b>
<b>Input-Output and Communication</b> - I/O interfacing: memory-mapped vs I/O-mapped I/O. Asynchronous data transfer: strobe and handshaking. Data transfer modes: programmed I/O, interrupt-driven I/O, and DMA, I/O protocols and buses: AMBA/AXI overview, Peripheral communication and CPU-IOP interactions.
<b>UNIT V</b>
<b>Memory Systems and Emerging Technologies</b> - Memory hierarchy: primary, secondary, cache, associative memory, Cache organization: mapping techniques, replacement policies. Virtual memory: paging, address translation, TLB. Modern memory technologies: DDR5, HBM, NVRAM, Memory design for embedded and AI systems.

<i>Suggested Text Books:</i>

Course Code	Course Title				Core/PE/OE		
PC 403 EC	<b>ELECTROMAGNETIC THEORY AND TRANSMISSION LINES</b>				<b>CORE</b>		
	<b>Contact Hours per Week</b>				<b>CIE</b>	<b>SEE</b>	<b>Credits</b>
<b>Prerequisite</b>	<b>L</b>	<b>T</b>	<b>D</b>	<b>P</b>			
<b>BS201MT</b>	<b>3</b>	<b>-</b>	<b>-</b>	<b>-</b>	<b>30</b>	<b>70</b>	<b>3</b>

**Course Objectives :** The course is taught with the objectives of enabling the student to:

1. Analyze fundamental concepts of vector analysis, electrostatics and magneto statics law and their applications to describe
- 2.
3. e the relationship between Electromagnetic Theory and circuittheory
4. Formulate the basic laws of static electricity and magnetism and extend them to time varying fields to define the Maxwell's equations in differential and integral form.
5. Derive the wave equations for conducting and di-electric mediums to analyze the wave propagation characteristics of Uniform Plane Waves (UPW) in normal and oblique incidences
6. Analyze fundamental concepts of Transmission lines and to formulate the basic relationship between distortion less transmission lines & applications.
7. Understand the concepts of RF Lines, their characteristics and analyze the applications of Smith Chart.

**Course Outcomes :** On completion of this course, the student will be able to :

1. Understand the different coordinate systems, vector calculus, coulombs law and gauss law for finding electric fields due to different charge distributions.
2. Learn basic magneto-statics concepts and laws such as Biot-Savart law and Amperes law, their application in finding magnetic field intensity.
3. Distinguish between the static and time-varying fields, establish the corresponding sets of Maxwell's Equations and Boundary Conditions, and use them for solving engineering problems.
4. Determine the Transmission Line parameters to characterize the distortions and estimate the characteristics for different lines.
5. Study the Smith Chart profile and stub matching features, and gain ability to practically use the same for solving practical problems

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12
<b>CO1</b>	3	2	-	2	-	-	-	-	-	1	-	1
<b>CO2</b>	3	2	2	2	-	-	-	-	-	1	-	1
<b>CO3</b>	3	2	-	2	-	-	-	-	-	1	-	1
<b>CO4</b>	3	2	-	3	-	-	-	-	-	1	-	1
<b>CO5</b>	3	2	-	-	-	-	-	-	-	1	-	1

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

#### **UNIT I : Electrostatics:**

Review of coordinate systems. Coulomb's Law, Electric Field Intensity, Electric field due to Line Charge , Sheet Charge and Volume Charge Distribution, Electric flux, Flux density. Gauss's Law and its applications. Energy and Potential, Potential of a point

charge, System of Charges, Potential gradient.
<b>UNIT II : Magneto-statics and Maxwell's Equations</b>
Steady magnetic field -Biot-Savart's law, Ampere's law. Stoke's theorem, Magnetic flux and magnetic flux density. Scalar and vector magnetic potentials. Electric and Magnetic fields boundary conditions. Maxwell's equations for static and time varying fields.
<b>UNIT III : Wave Equations and Reflection</b>
Uniform plane waves in free space and in conducting medium, Wave Polarization-Linear, Circular and Elliptical Polarization, Poynting theorem. Reflection of Uniform Plane Wave at Normal incidence and oblique incidence on dielectrics medium, Reflection Coefficient, Transmission Coefficient.
<b>UNIT IV: Transmission Lines at Low Frequency</b>
Types of Transmission Lines-Two wire lines and its circuit representation, Primary and secondary constants. Transmission Line equations, Infinite line, characteristic impedance of Open and short circuit lines and their significance. Distortion less transmission line, Concept of loading of a transmission line, Campbell's formula.
<b>UNIT V: Transmission Lines at High Frequency</b>
Impedance at any point on the transmission line- Input impedance. RF and UHF lines, transmission lines as circuit elements. Properties of $\lambda/2$ , $\lambda/4$ and $\lambda/8$ Lines. Reflection and VSWR. Matching: Stub matching. Smith chart and its applications.

PC 404 EC	PULSE AND LINEAR INTEGRATED CIRCUITS					Core	
	Contact Hours per Week				CIE	SEE	Credits
Prerequisite	L	T	D	P			
PC 304 EC	3	1	-	-	30	70	4
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Discuss the behavior and applications of linear and non-linear wave shaping circuits.							
2. Describe the design and operation of multivibrators and time base generator circuits							
3. Analyze the characteristics of differential amplifiers and operational amplifiers							
4. Implement OP-AMP-based circuits for amplification, filtering, and waveform generation.							
5. Explain the functionality of 555 timer, PLL, and their applications in data converters and voltage regulation.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Analyze the response of linear wave shaping circuits to various input signals							
2. Design multivibrator and sweep circuits using transistors							
3. Analyze DC and AC characteristics of differential amplifier configurations using BJTs and operational amplifiers.							
4. Implement various linear and non-linear applications of operational amplifiers							
5. Demonstrate the various applications of 555 Timer and analyze the operation of the D/A and A/D converters.							

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12

CO5	3	3	2	3	3	1	1	-	-	-	-	1

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

### UNIT I

**Linear Wave Shaping:** Highpass, lowpass RC circuits, their response for sinusoidal, step, pulse, square and ramp inputs. RC network as differentiator and integrator, attenuators, its applications in CRO probe.

**Non-Linear Wave Shaping:** Diode clippers, Transistor clippers, clipping at two independent levels, Comparators, applications of voltage comparators. Clamping operation, clamping circuit taking Source and Diode resistances into account, Clamping circuit theorem.

### UNIT II

**Multivibrators:** Analysis and Design of Bistable, Monostable, Astable Multivibrators and Schmitt trigger using transistors.

**Time Base Generators:** General features of a time base signal, methods of generating voltage time base waveform.

### UNIT III

**Differential amplifiers:** Classification, DC and AC Analysis of Single/Dual input Balanced and Unbalanced output configurations using BJTs. Level Translator.

<b>Operational Amplifier:</b> OPAMP Block diagram, ideal Op-amp characteristics, Op-amp and its features, Op-amp parameters and Measurements, Input and Output Offset voltages and currents, Slew rate, CMRR, PSRR. Frequency response and Compensation Techniques
<b>UNIT IV</b>
OP-AMP Applications: Inverting and Non-Inverting Amplifiers, Integrator and differentiator, summing amplifier, precision rectifier, Schmitt trigger and its applications. Active filters: Lowpass, high pass, band pass and band stop. Log and Anti Log Amplifiers
<b>UNIT V</b>
<b>555 Timer:</b> Functional Diagram, Monostable, Astable and Schmitt Trigger Applications. Fixed and variable voltage regulators, PLL and its Applications. <b>Data Converters:</b> Digital-to-analog converters (DAC): Weighted resistor, inverted R-2R ladder, Analog-to-digital converters (ADC): dual slope, successive approximation, flash, Specifications

	<b>Contact Hours per Week</b>				<b>CIE</b>	<b>SEE</b>	<b>Credits</b>
<b>Prerequisite</b>	<b>L</b>	<b>T</b>	<b>D</b>	<b>P</b>			
PC 301 EC	3	-	-	-	30	70	3
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. To describe the necessity and efficiency of digital signal processing.							
2. To analyze signals in the frequency domain using the principles and applications of Fast Fourier Transform (FFT) for improved computational efficiency.							
3. To discuss various design methods of FIR & IIR filters.							
4. To describe the concepts of Multirate signal processing							
5. Identify important features of TMS320C67XX DSP processors.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Apply the knowledge of FFT Algorithms for computation of DFT.							
2. Design of FIR filters using various methods.							
3. Design of IIR filters using various methods.							
4. Apply decimation and interpolation concepts for the design of sampling rate converters.							
5. Understand TMS320C67XX DSP processors for the design of digital filters.

CO4	2	2	1	-	-	-	-	-	-	-	-	3
CO5	3	3	1	-	-	-	-	-	-	-	-	3

<b>UNIT I</b>
<b>Discrete Fourier Transform and Fast Fourier Transform:</b> Discrete Fourier Transform (DFT), Computation of DFT- Linear and Circular Convolution, FFT algorithms: Radix-2 Decimation in Time and Decimation in Frequency algorithms, In place computation, Bit reversal.
<b>UNIT II</b>
<b>Finite Impulse-Response Filters (FIR):</b> Linear phase filters, Windowing techniques for design of Linear phase FIR Filters-Rectangular, triangular, Bartlett, Hamming, Hanning, Kaiser windows, Realization of filters, Finite word length effects.
<b>UNIT III</b>
<b>Infinite Impulse-Response Filters (IIR):</b> Introduction to filters, comparison between practical and theoretical filters, Butterworth and Chebyshev approximation, IIR digital filter design Techniques, Impulse Invariant technique, Bilinear transformation technique, Digital Butterworth & Chebyshev filters, Implementation, Digital filters structures, Comparison between FIR and IIR.
<b>UNIT IV</b>
<b>Multirate Digital Signal Processing:</b> Introduction, Decimation by factor D and interpolation by a factor I, Sampling Rate conversion by a Rational factor I/D. Implementation of Sampling Rate Conversion: Multistage implementation of sampling rate conversion, Application of

Multirate Signal Processing.
<b>UNIT V</b>
<b>Introduction to DSP Processors:</b> Difference between DSP and other microprocessors architectures Importance of DSP Processors- General purpose DSP processors TMS320C67XX processor, architecture, registers, pipelining, addressing modes and Introduction to instruction set.

Prerequisite	Contact Hours per Week				CIE	SEE	Credits
	L	T	D	P			
BS202PH	3	-	-	-	30	70	3
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Understand the different standards of measurements.							
2. Study different types of transducers.							
3. List various types of physical quantities measurements.							
4. Learn the design of measuring Instruments.							
5. Study various types of bio-medical instruments							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Describe characteristics of electronic measurements and state different Standards of measurements.							
2. Identify and explain different types of Transducers.							
3. Interpret types of transducers for Sound, Temperature.							
4. Design and analyze the digital voltmeters, spectrum analyzers and Prioritize the instruments.							
5. Identify and classify types of Biomedical instruments.

CO5	1	-	1	-	-	1	-	-	-	-	-	-

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>UNIT I</b>
<b>Electronic Measurement fundamentals:</b> Accuracy, Precision, Resolution and Sensitivity. Errors and their types. Standards of measurement, classification of standards, IEEE standards.
<b>UNIT II</b>
<b>Transducers:</b> Classification, factors for selection of a transducer, transducers for measurement of velocity, Pressure and Humidity. Passive electrical transducers- Strain gauges and strain measurement, LVDT and displacement measurement, capacitive transducer and thickness measurement. Active electrical transducers: Piezo electric, photo conductive, photo voltaic and photo emissive transducers.
<b>UNIT III</b>
<b>Electronic Sensors:</b> Characteristics of sound, pressure, power and loudness measurement. Microphones and their types. Temperature measurement, resistance wire thermometers, semiconductor thermometers and thermo-couples. Optical and Magnetic sensors, pH sensor.

**UNIT IV**

**Measuring instruments:** Block diagram, specification and design considerations of different types of DVMs. Spectrum analyzers. The IEEE488 or GPIB Interface and protocol. Delayed time base oscilloscope and Digital storage oscilloscope. Introduction to virtual instrumentation, SCADA. Data acquisition system block diagram

**UNIT V**

**Biomedical Instrumentation:** Human physiological systems and related concepts. Bio-potential electrodes Bio-potential recorders – ECG, EEG, EMG, X- ray machines and CT scanners, magnetic resonance and imaging systems, Ultrasonic Imaging systems.

PC 451 EC	<b>ANALOG ELECTRONIC CIRCUIT LAB</b>					<b>Core</b>	
	<b>Contact Hours per Week</b>				<b>CIE</b>	<b>SEE</b>	<b>Credits</b>
<b>Prerequisite</b>	<b>L</b>	<b>T</b>	<b>D</b>	<b>P</b>			
PC 401 EC	-	-	-	2	<b>25</b>	<b>50</b>	<b>1</b>
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Analyze and Verify frequency response of BJT and FET amplifiers							
2. Design different negative feedback amplifiers circuits							
2. Design AF and RF oscillator circuits							
4. Design power amplifiers							
5. Demonstrate various circuits using PSPICE and verifying functionality							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Design, construct, and evaluate RC-coupled amplifiers using BJTs.							
2. Understand and implement different types of feedback topologies in amplifier circuits							
3. Design and construct sinusoidal oscillator circuits							
4. Analyze and design various amplifier circuits tuned, and power amplifiers using BJT and FET,							
5. Apply circuit simulation tools (like SPICE) to verify and analyze the behavior of amplifier							

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12
CO1	3	2	3	2	2	-	-	-	-	-	-	-
CO2	3	2	3	2	1	-	-	-	-	-	-	-
CO3	3	2	3	2	2	-	-	-	-	-	-	-
CO4	3	3	3	2	2	-	-	-	-	-	-	-
CO5	2	3	2	3	3	-	-	-	-	-	-	-

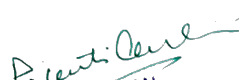

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>PART A</b>
1. Design and plot the frequency response of a single-stage RC coupled amplifier using a BJT. Analyze the gain and bandwidth of the amplifier.
2. Design and plot the frequency response of a single-stage RC coupled amplifier using a FET. Compare performance with BJT-based amplifiers.
3. Design and analyze a voltage series negative feedback amplifier. Measure the gain and observe the effect of feedback on bandwidth and distortion.
4. Design and analyze a current shunt negative feedback amplifier. Determine the changes in input/output impedance due to feedback.
5. Design and analyze a voltage shunt negative feedback amplifier. Observe and explain the changes in amplifier gain due to feedback.
6. Design, construct, and study a current series negative feedback amplifier. Measure the impact of feedback on the amplifier's stability and frequency response.
7. Simulate and analyze BJT amplifier circuits using SPICE. Plot frequency responses and compare simulation results with theoretical calculations

<b>PART B</b>	
1.	Design and analyze Hartley and Colpitts oscillators using BJTs. Calculate and compare the theoretical and practical oscillation frequencies.
2.	Design RC phase shift oscillator using a BJT. Verify the frequency of oscillation and waveform .
3.	Design and construct a Class-A power amplifier. Plot the input-output characteristics and evaluate power efficiency and distortion levels
4.	Design and plot the frequency response of single-tuned amplifiers. Study selectivity and bandwidth characteristics.
5.	Design and implement a transistor-based voltage regulator. Test its line and load regulation capabilities under different load conditions.
6.	Simulate and analyze FET amplifier circuits using SPICE. Plot frequency responses and compare simulation results with theoretical calculations
7.	Design and plot the frequency response of single-tuned amplifiers. Study selectivity and bandwidth characteristics

Note :Students are required to perform minimum 10 experiments, 5 experiments from Part A and 5 experiments Part B.

PC 452 EC	<b>PULSE AND LINEAR INTEGRATED CIRCUITS LAB</b>				<b>Core</b>		
	<b>Contact Hours per Week</b>				<b>CIE</b>	<b>SEE</b>	<b>Credits</b>
<b>Prerequisite</b>	<b>L</b>	<b>T</b>	<b>D</b>	<b>P</b>			
PC 404 EC	-	-	-	2	25	50	1
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Analyze low-pass and high-pass RC circuits, clipping, and clamping circuits for waveform shaping and filtering.							
2. Design and construct transistor-based bistable, monostable, and astable multivibrators.							
3. Demonstrate the working of OPAMP circuits like amplifiers, followers, integrators, differentiators, and filters.							
4. Develop and test NE555 timer and OPAMP-based multivibrator circuits for timing applications.							
5. Apply waveform generation principles to build and analyze Schmitt triggers, Miller sweep, and UJT relaxation oscillators.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Analyze RC circuits, clippers, and clampers for their waveform shaping characteristics.							
2. Design and evaluate transistor-based multivibrator circuits.							
3. Implement OPAMP-based circuits for signal conditioning and processing.							
4. Develop timer-based multivibrators using NE555 IC and OPAMPs.							
5. Construct waveform generators like Schmitt triggers, sweep circuits, and UJT oscillators.							

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12

CO4	3	3	3	2	3	1	-	-	1	3	1	-
CO5	3	3	3	2	2	1	-	-	1	3	1	-

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

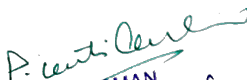

<b>PART A</b>
1. Analyze the response of low-pass and high-pass RC circuits for various time constants
2. Verify the characteristics clipping circuits
3. Verify the characteristics Clamping Circuits
4. Study the characteristics of a transistor used as a switch
5. Design and analyze the characteristics of a collector-coupled bistable multivibrator using transistors
6. Design and analyze the characteristics of a collector-coupled Monostable Multivibrator using transistors
7. Design and analyze the characteristics of a collector-coupled Collector Coupled

Astable Multivibrator using transistors
<b>PART B</b>
1. Design and verify the characteristics of inverting, non-inverting and voltage follower using Op-Amp.
2. Design and verify the characteristics of Op-Amp based integrator and differentiator circuits
3. Design and verify the characteristics of active low-pass, high-pass, and band-pass filters using Op-Amp.
4. Construct and analyze a Schmitt trigger using Op-Amp to understand hysteresis and waveform shaping.
5. Design and verify the characteristics of astable and monostable multivibrator circuits using the NE555 timer IC.
6. Verify the characteristics of a Miller sweep circuit for linear ramp voltage generation
7. Verify the characteristics of a UJT relaxation oscillator for waveform generation.

**Note :** A minimum of 10 experiments should be performed with atleast 5 from each section

PC 453EC	DIGITAL SIGNAL PROCESSING LAB					Core	
	Contact Hours per Week				CIE	SEE	Credits
Prerequisite	L	T	D	P			
PC405EC	-	-	-	2	30	70	1
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. To develop MATLAB programs for operation of sequences.							
2. To implement the program of DFT, IDFT, FFT and IFFT on discrete time signals.							
3. To design and obtain the frequency response of various digital filters.							
4. To familiarize students with the architecture and functionality of the TMS320C67XX DSP processor and to utilize the DSP kit for real-time processing and manipulation of audio signals.							
5. To interface input/output devices with the DSP kit and implement real-time FIR and IIR filters for data acquisition and output signal processing.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Develop MATLAB files for the verification of system response.							
2. Design and analyze the digital filters using MATLAB.							
3. Verify the functionality of FFT algorithms.							
4. Experiment with multirate techniques using MATLAB & CCS.							
5. Design and implement the digital filters on DSP processor.							

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12

CO5	3	3	3	3	3	-	-	-	-	-	-	-

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>PART A: Perform the following programs using MATLAB Simulator</b>
1. Introduction to MATLAB and signal generation.
2. Perform Linear Convolution.
3. Perform Circular Convolutions.
4. Perform DFT and FFT algorithm
5. Perform FIR filters design using different window functions.
6. Perform IIR filters design: Butterworth and Chebyshev, LPF, HPF, BPF & BSF filter.
7. Perform Interpolation and Decimation.
8. Implementation of multi-rate systems.
<b>PART B :Implement the following experiments using DSK(TMS320C67XX)</b>
1. Introduction to DSP processors and Study of procedure to work in real-time.
2. Implement Solution of difference equations.
3. Implement Impulse Response.
4. Implement Linear Convolution.
5. Implement Circular Convolution.
6. Implement Fast Fourier Transform Algorithms.

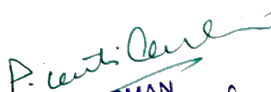

7. Design of FIR (LP/HP) USING windows :(a) Rectangular (b) Triangular(c)Hamming windows.
8. Design of IIR (HP/LP) filters.

**Note:**

1. Atleast ten experiments to be conducted in the semester.
2. Minimum of 5 from Part A and Part B is compulsory.
3. For Section-A 'MATLAB with different toolboxes like signal processing. block set and SIMULINK/MATHEMATICA/ any popular software can be used.

**Suggested Text Books:**

1. Digital Signal Processing: Principles, Algorithms, and Applications by John G. Proakis and Dimitris G. Manolakis, Pearson Education / PHI, 2007.
2. Discrete-Time Signal Processing by Alan V. Oppenheim and Ronald W. Schaffer, PHI.
3. Digital Signal Processing by S. Salivahanan, A. Vallavaraj, and C. Gnanapriya, TMH, 2009

Prerequisite	L	T	D	P/D			
BS202PH	3	-	-	-	30	70	3
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Understand the characteristics of diodes and its applications.							
2. Understand the design concepts of biasing of BJT and FET							
3. Understand the design concepts of feedback amplifiers and oscillators							
4. Study the design concepts of OP Amp.							
5. Understand the concepts of Data Acquisition Systems and data converters							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Study and analyze the rectifiers and regulator circuits.							
2. Study and analyze the performance of BJTs, FETs on the basis of their operation and working.							
3. Study& design oscillator circuits.							
4. Studyand analyze different Op amps and its applications.							
5. Study and analyze different data acquisition systems

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>UNIT I</b>
<b>PN Junction Diode:</b> Characteristics, Half wave rectifier, Full wave rectifier, filters, ripple, regulation, TIF and efficiency, Zener diode and Zener diode regulators. CRT construction and CRO applications.
<b>UNIT II</b>
<b>Transistors:</b> BJT construction and working, modes of operation, configurations of BJT (CB, CE, CC), small signal h-parameter model of CE, CE amplifier analysis. Construction and working of JFET, V-I characteristics of JFET.
<b>UNIT III</b>
<b>Feedback concepts:</b> Types of negative feedback – modification of gain, bandwidth, input and output impedances, applications. <b>Oscillators:</b> RC Phase shift, Wein bridge, LC and crystal Oscillators (Qualitative treatment only).
<b>UNIT IV</b>
<b>Operational Amplifier:</b> OP-AMP Block diagram, Ideal OP-AMP, DC and AC Characteristics, Inverting and Non-Inverting Amplifiers, Adder/Subtractor, Integrator, Differentiator, Precision rectifier , Schmit trigger and its applications.
<b>UNIT V</b>
<b>Data Acquisition Systems:</b> Construction and Operation of transducers- Strain

guageLVDT, Thermo couple, Instrumentation systems.

**Data Converters:** R-2R Ladder DAC, Successive approximation and Flash ADC.

<b>LIST OF EXPERIMENTS</b>
1. CRO-Applications, Measurements of R, L and C using LCR meter, Colour code method and soldering practice.
2. Characteristics of Semiconductors diode Ge, Si and Zener.
3. Static Characteristics of BJT-Common Emitter.
4. Static Characteristics of BIT-Common Base.
5. Static Characteristics of FET.
6. RC-Phase Shift Oscillator.
7. Hartley and Colpitts Oscillators.
8. Common Emitter Amplifier.
9. Astable Multivibrator.
10. Full-wave rectifier with and without filters using BJT.
11. Operational Amplifier Applications.
12. Strain Gauge Measurement.
13. Analog-to-Digital and Digital to Analog Converters.

<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Understand the fundamental principles of digital hardware design and number systems.							
2. Apply Boolean algebra and logic minimization techniques to implement combinational circuits efficiently, modelling of circuits using Verilog HDL.							
3. Analyze the functionality and timing characteristics of sequential circuits using various flip-flops and latches.							
4. Design finite state machines (FSMs) for real-time digital applications using synchronous sequential logic.							
5. Explore the architecture and design methodologies using programmable logic devices like PALs, PLAs, CPLDs, and FPGAs.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Explain the fundamentals of digital hardware design, logic gates, Boolean algebra, and logic synthesis.							
2. Design and optimize combinational circuits using K-Map and Quine-Mc Cluskey methods and modelled using Verilog HDL.							
3. Construct and analyze various sequential circuits including flip-flops, registers, and counters.							
4. Develop FSM-based digital systems for sequence detection and generation using Mealy/Moore models.							
5. Implement combinational logic using PLDs such as PALs, PLAs, CPLDs, and FPGAs.

<b>CO5</b>	3	2	3	2	-	-	-	-	-	-	-	2

<b>UNIT – I</b>
<b>Design Concepts:</b> Digital Hardware, Design process, Design of digital hardware. Number systems and codes. Introduction to logic circuits – Variables and functions, Logic gates and networks. Boolean algebra, Synthesis using gates, Design examples.
<b>UNIT – II</b>
Number representation: Addition and Subtraction of signed and unsigned numbers. Combinational circuit building blocks: Adders and Subtractors, Multiplexers. Demultiplexers, Parity Checkers and Generators, Decoders. Encoders. Code converters, BCD to 7-segment converter, Arithmetic comparator circuits. Verilog modeling of simple combination circuits.
<b>Logic Optimization:</b> Optimized implementation of logic functions using K-Map and Quine-Mc Cluskey Tabular method.
<b>Combinational Circuit Design:</b> Adders and Subtractors, Multiplexers, Demultiplexers, Parity Checkers and Generators, Decoders, Encoders, Code converters, BCD to 7-segment converter and Arithmetic comparator circuits. Verilog modeling (Gate level and Dataflow) of simple

combination circuits.
<b>UNIT – III</b>
Sequential Circuits: Basic Latch, Gated SR Latch, gated D Latch, Master-Slave edge triggered flip-flops, T Flip-flop, JK Flip-flop, Excitation tables, Timing diagrams and analysis, Flip flop conversions, Set-up and hold time, Registers and Counters.
<b>UNIT – IV</b>
<b>Synchronous Sequential Circuits:</b> Basic Design Steps, Finite State machine (FSM) representation using Moore and Mealy state models, State minimization, Design of FSM for Sequence Generation and Detection, Algorithmic State Machine charts.
<b>UNIT – V</b>
Design of combinational circuits using Programmable Logic Devices (PLDs): General structure of a Programmable Array Logic (PAL), Programmable Logic Arrays (PLAs), Structure of CPLDs and FPGAs, 2-input and 3-input lookup tables (LUTs).

ES401EC	SIGNALS AND SYSTEMS					Core	
Prerequisite	Contact Hours per Week				CIE	SEE	Credits
	L	T	D	P			
BS201MT	3	-	-	-	30	70	3
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Analyze basic concepts related to continuous time signals and systems, mathematical representation of periodic signals.							
2. Familiarize with basic operations on signals and mathematical representation of aperiodic signals using Fourier and Laplace transform.							
3. Analyze basic concepts related to discrete time signals and systems, mathematical representation discrete time signals.							
4. Describe the concept of Z- Transform and its properties and illustrate their applications to analyze systems.							
Define convolution, correlation operations on continuous and discrete time signals.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Define and differentiate types of signals and systems in continuous and discrete time.							
2. Apply the properties of Fourier transform for continuous time signals.							
3. Relate Laplace transforms to solve differential equations and to determine the response of the Continuous Time Linear Time Invariant Systems to known inputs.							
4. Apply Z-transforms for discrete time signals to solve Difference equations.							
5. Obtain Linear Convolution and Correlation of discrete time signals with graphical representation.							

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12

CO4	3	2	3	3	-	-	-	-	-	-	-	1
CO5	3	2	3	2	-	-	-	-	-	-	-	1

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>UNIT I</b>
<b>Definitions and classifications:</b> Classification of signals. Elementary continuous time signals, Basic operations on continuous-time signals. Classification of continuous-time systems: continuous time & discrete time systems, lumped-parameter & distributed –parameter systems, static & dynamic systems, causal & non-causal systems, Time-invariant & time-variant systems, stable & unstable systems.
<b>UNIT II</b>
<b>Representation of Continuous-time signals:</b> Analogy between vectors and signals, orthogonality and completeness. <b>Fourier series Analysis of Continuous-time signals:</b> Fourier series – Existence of Fourier series, Trigonometric and Exponential Fourier series, computational formulae, symmetry conditions, complex Fourier spectrum.
<b>UNIT III</b>

<p><b>Continuous-time Fourier Transform (FT):</b> The direct and inverse FT, existence of FT, Properties of FT, FT of standard signals, properties of FT, The Frequency Spectrum.</p> <p><b>Linear Convolution of continuous time signals:</b> Graphical interpretation, properties of convolution, Correlation between continuous-time signals: Auto and Cross correlation, graphical interpretation, properties of correlation.</p>
<b>UNIT IV</b>
<p><b>Discrete-time signals and systems:</b> Sampling, Classification of discrete-time signals, Basic operations on discrete time signals, Classification of discrete time systems, properties of systems.</p> <p><b>Linear Convolution of discrete time signals:</b> Graphical interpretation, properties of discrete convolution</p> <p><b>Fourier analysis of discrete-time signals:</b> Discrete-time Fourier transform (DTFT), properties of DTFT, Transfer function, Discrete Fourier transform properties of DFT.</p>
<b>UNIT V</b>
<p><b>Z-Transform analysis of signals &amp; systems:</b> The direct Z transform, Region of convergence, Z-plane and S-plane correspondence. Inverse Z transform, Properties of Z-transforms. Solution to linear difference equations, Linear constant coefficient systems, System transfer function.</p>

ES302EC	Analog Electronic Circuits					Core	
	Contact Hours per Week				CIE	SEE	Credits
Prerequisite	L	T	D	P			
ES301EE	3	-	-	-	30	70	4
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Study the characteristics of diode in forward and reverse bias and applications of diodes.							
2. Describe the construction and working of Bipolar Junction Transistor in various modes and JFET.							
3. Familiarize with feedback concepts and identify various types of feedback amplifiers.							
4. Study the importance of power amplifiers and Oscillators.							
5. Understand the operation and applications of op-amps.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
1. Interpret the characteristics and apply diode models to analyze various applications of diodes							
2. Discriminate the BJT configurations to recognize appropriate transistor configuration for any given application and design the biasing circuits with good stability							
3. Analyze and compare feedback amplifiers.							
4. Distinguish various classes of Power Amplifiers.							
5. Analyze the operation of OPAMP and its applications.

CO5	3	2	3	2	-	-	-	-	-	-	-	2

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>UNIT I</b>
P-N junction characteristics, V-I characteristics, Avalanche breakdown, Zener diode, Applications of Diodes as rectifiers. Filters (L, C), LED, photodiode. Basic Clipping and clamping circuits using diodes. (One level only).
<b>UNIT II</b>
Bipolar Junction Transistor - V-I characteristics, JFET - I-V characteristics, and various configurations (such as CE/CS, CB/CG, CC/CD) and their features. Small signal models of BJT and JFET. Analysis of BJT as an amplifier, estimation of voltage gain, current gain, input resistance, output resistance. <b>Transistor Biasing:</b> Fixed bias, collector to base bias, self-bias, thermal stability, heat sinks.
<b>UNIT III</b>
Concept of Feedback - positive and negative, Feedback topologies: Voltage series, current series, voltage shunt, current shunt, effect of feedback on gain, bandwidth etc., and concept of stability. (Qualitative treatment only).

<b>UNIT IV</b>
<b>Oscillators:</b> Barkhausen criterion, RC oscillators (phase shift, Wien bridge), LC oscillators (Hartley, Colpitts), CRYSTAL Oscillator. (Qualitative treatment only) <b>Power Amplifiers:</b> Various classes of operation (Class A, B, and AB), their power efficiency and distortion (Qualitative treatment only).
<b>UNIT V</b>
OP-AMP Block diagram, Ideal OP-AMP,DC and AC Characteristics, Inverting and Non-Inverting Amplifiers, Adder/Subtractor, Integrator, Differentiator, Comparator, Zero crossing detector, Square and Triangular wave generators, Peak detector, Sample and Hold circuit and Precision Rectifiers.

Prerequisite	L	T	D	P			
ES301EE	-	-	-	2	25	50	1
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
Designing basic circuits of rectification with and without filters using diodes							
Designing wave shaping circuit using diodes.							
Designing of single and multistage amplifier circuits.							
Demonstrate negative feedback in amplifier circuits and positive feedback in Oscillators							
Design of P, PI and PID controllers.							
<b>Course Outcomes :</b> On completion of this course, the student will be able to :							
Calculate ripple factor, efficiency and % regulation of rectifier circuits							
Analyse feedback amplifiers and op-amp oscillator circuits							
Design single, and multi-stage amplifier, wave shaping and controller circuits							
Understand the characteristics of electronics devices							
Design of P, PI and PID controllers using op-amps.

CO5	2	3	2	3	3	-	-	-	-	-	-	-

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

List of Experiments
1. Characteristics of Silicon, Germanium and Zener Diode in forward bias and reverse bias
2. Application of diode as a full wave rectifier with and without filters. Calculation of Ripple factor, voltage regulation and efficiency with various loads
3. Static characteristics of BJT in CE configuration
4. Static characteristics of MOSFET in CS configuration
5. Frequency response of Single and two stage BJT amplifier in CE configuration
6. Frequency response of Single and two stage MOSFET amplifier in CS configuration
7. Inverting amplifier using op-amp.
8. Non inverting amplifier using op-amp.
9. Instrumentation amplifier.
10. Design of integrator and differentiator using op-amp.
11. RC Phase Oscillator and Wein Bridge Oscillator using op-amp.
12. A/D converters.
13. Clipping circuits
14. Clamping Circuits.
15. Monostable Multivibrator using op-amp.
16. Generation of triangular and square wave using op-amp.
17. Design of P, PI and PID controller using op-amp.
18. Design of Lead/lag compensator using op-amp

<b>Prerequisite</b>	<b>L</b>	<b>T</b>	<b>D</b>	<b>P/D</b>			
-	3	-	-	-	30	70	3
<b>Course Objectives :</b> The course is taught with the objectives of enabling the student to:							
1. Understand the architecture and programming of 8051 Microcontroller.							
2. Learn the memory organization & instruction set of 8051 microcontroller.							
3. Getfamiliarityofassemblylanguage programmingof I/O ports, Timers/Counters& UART using 8051 Microcontroller.							
4. Todevelopinterfacing of real time programmable devices like ADC, DAC, LCD and stepper motor with 8051.							
<b>Course Outcomes:</b> On successful completion of the course, the students will be able to:							
1. Explaintheinternal architectureof an8-bit8051 Microcontroller							
2. Explain the Memory Organization, 8051 Pin Configuration & Instruction Set of 8051Microcontroller.							
3. Learn the 8051 Addressing modes, 8051 Instruction Set & write simple ALPs.							
4. Program Timers/Counters, Serial Communication & Interrupts							
5. Interface different programmable peripheral devices to 8051 microcontroller.

Correlation rating: Low / Medium / High: 1 / 2 / 3 respectively.

<b>UNIT I</b>
<b>Introduction to Microcontrollers&amp; its Architecture:</b> Overview of Microprocessors andMicrocontrollers, Differences between Microprocessors andMicrocontrollers, Hexadecimal numbering system,Salient features of 8051 Microcontroller, 8051 Microcontroller family, Internal Architecture of 8051 Microcontroller, PSW.
<b>UNIT II</b>
<b>8051 Memory, Pin Configuration &amp; Instruction Set:</b> 8051 Memory Organization (Internal & External Memories), 8051 Pin Configuration, Crystal Oscillator frequency, Machine cycles, Stack of 8051, 8051 Instruction Set.
<b>UNIT III</b>
<b>8051 Addressing Modes&amp; Assembly Language Programming:</b> Addressing modes, bit addressable features, I/O port structures, Assembly Language Programming using data transfer, arithmetic, logical and branch instructions with simple programs.
<b>UNIT IV</b>
<b>8051 Timers,Serial PortandInterrupts:</b> 8051 Timers/Counters and its programming, Serial data communication, Serial port and its programming, 8051 interrupts, Interrupt vector table, Interrupts programming.

**UNIT V**

**8051 Interfacing:** Interfacing of 8051 with Digital-Analog Converter, Stepper motor & LCD interfacing.

Converter, Analog-Digital
